

1 NF :- already in 1NF, Because Department location was multivalue attribute, and so during ERD

2 NF :- only matters for relations with a composite PK, Since a single-attribute PK can't have a "partial" dependency.

3 NF :- Since the relation between Department with (SSN) → From Employee with (manage) From Department . (1:1), is SSN unique per row making it a Candidate Key (not just a non key attribute). ~~and~~ dependency from candidate key isn't a 3NF violation. it's just alternate key determining the Row.

②) Project

<u>P_Num</u>	P_Name	location	<u>D_Num</u>
--------------	--------	----------	--------------

 ⇒ location - city

<u>Plocation</u>	Pcity
------------------	-------

OR if Plocation and Pcity are independent descriptive fields. Leave it as one table.
